Plymouth Center log book

11 September 1990 1515 arrive onsite contain
meet with security service women. On rain
duty until 12midnight. Building ants
locked. 5 brown drums located outside
near to entrance door. Empty flammable when
liquid. One yellow drum on west side of building of
full? activity

3- 55gal full of pot ash / acid-waste
cleanup ity but

meet Mark manor

Clean-up John Kamphius / Hank te
Paint was poured in 55gal 1 40% full
added "industrial absorbent" material
return
Maintain Building - will ^{not sweep} ~~sweep~~ each room.

Grain elevator & pesticides stored in basement. Used

6-10gal pails-concrete 3 drums motor oil |
1 cylinder unknown in basement

Paint cans in trash bin. - took photo visit
800 gallons by the sides. - not ~~certain~~ certain Ralph
K&D on site a couple of days - soda ash, or
over pack drum.

Batteries were sold - lead

Samples sent to lab- Air pollution press

12-9 Mark plans to leave site 12noon eff

Hank may come out to help.

Mark manor took me around the buildings outside,
and inside to see what he has been doing.

K&D only worked ~2 days to clean-up the
soda ash that was placed on the basement
floor. The batteries were sold - removed from and
basement. Drums in basement had been
over packed and removed and staged on the first floor, waiting for lab results to drums

disposed of. No odor was noticed. K+D left 1 bag of soda ash on 1st floor unopened. 1/2 bag soda ash in basement opened, basement still needs to be vacuumed to remove the soda ash from floor. K+D left behind tonneh on the floor. Basement had no lighting, light from the stair wells only. Walked over to the grain elevator to where the pesticides were stored. Mark manor moved them into the heating house because the grain elevator has no locks. Volume of pesticides: 25 - 1 gal containers. (Also the drum samples went to Air pollution Laboratory.) No samples have been taken of the pest, to be analyzed. In the maintenance building Mark manor and John Kamphius have been sweeping each room and collecting paint cans and any other potential hazard that may exist in the building. The direction of proper disposal comes from Hank Maciejewski. The paint material has been mixed w/ industrial absorbent in a 55-gal drum. The paint cans wiped clean and put into the dumpster. Mark took me over to see (I had him photo the cans - because I'm short to look over into, taller than 5'5"). One 55 gal drum had leaked onto the floor of the maintenance building, Mark manor placed absorbent material to collect it (still on floor). Mark manor made reference to the 5-gal pails (many) that the material inside has hardened. I was unable to count them all. Nothing has been staged. I noticed one gas cylinder located in the main center of building maintenance. And also in the grain elevator one gas cylinder in the basement.

along with ~3-55gal drums may contain oil, volume unknown. Access into grain elevator basement; doors are open. Contents need to be analyzed.

Security has been on site for 24 hours - when I arrived they were present. No daily log of whom has arrived onsite by security - no activity sheet. No port-a-john on site. Security has been using the woods (or must leave, but I'm not certain of it).

12 September Mark manor is to be on site to continue clean-up in maintenance building. I left the site @ 1640 return to our office.

13 September 1990 TATU-Thompson called OSC Ralph Dollhopf to give him verbal update. Mark manor is to call osc every day with up-date. TAT Thompson to visit site when osc request to be out there. Ralph will call. No set schedule by markmanor or osc to report to site.

24 September 1990 TATU Thompson called OSC Dollhopf to ask about progress of site. OSC Dollhopf is waiting himself for people to call him back. He will call me this week with up-date of activities.

27 September 1990 TATU Thompson @ 1000 arrived on site to meet with Mark manor and John Kamphius from Wayne County, and Robert Tomson and Rick Rossalle from Northville township Fire Department (NTFD) to discuss the current activities. The 2-55gallon drums

that contain paint & industrial absorbent (mixed) have been moved into the boiler building. the maintenance building has been cleared of all potentially hazardous materials, that were on the floor in every room. Motor oil drums have not been sampled or moved from building. The pesticides have been moved into a cover pack drum and stored in the boiler building (still), and sampled - waiting for results - sent to Air Pollution Laboratory. (4- 1 gallon containers). The 55-gallon drums that were moved from the basement of boiler building are waiting for all the analytical results - still pending. Mark Manor proposed that the drums be stored at the WTPD fire station, located off of the Wayne County property - denied by Chief Toms, Rick Roselle WTPD, proposed that they use the old garage and brick up the doors and that the WTPD could drive by - regular - until proper dispo completed. Mark Manor & John Kamphius will look into this - they must contact the people in charge. Then call OSC Dollhopf for approval. Air sampling - pending. The site is approx. 936 acres.

No asbestos is found in these buildings - samples have been collected, results in. I asked that they send a copy to OSC Dollhopf.

Gas cylinders - present in Maintenance.

The grain elevator still contains 1- 55 gallon drum of motor oil, which needs to be moved & sampled - @ 11/5 finished meeting returned to office and called OSC Dollhopf with update. Andria Linda Thompson
